#### Abstract

Oh well, here we go again. I was'rit going to put anything in this months but Gavin threatened me with greivious bodily harm if I did'nt. As you no doubt know last months meeting was a shambles (sorry about that chief). we had big printing problems with the newsletter as our regular printer is away at the moment and Gavin called on everybody except the Army to get it done. After a lut of hassles he managed to produce enough copies for the meeting only, 50 all you subscribers who failed to get your copy last month will recieve two moriths this time around and I thank you for being so understanding.

#### Abstract

Having had quite a few Datasette problems over the years, mainly the last five manths, and hot being very impressed with the DR20 which I consider to be overpriced and unreliable I bought an Aquarius data recorder for use on the VZ300. I'm happy to say it's a Bloody Ripper. It loads everything I put into it regardless of which machine the program was recorded ori, all this for $\$ 9.95$. As you may know, what is recorded on a tricky dicky Datasette will not always play back on a non tricky dicky brand, but it seems the aquarius will accept almost anything. It would be ideal as a backup but you may be lucky to get one as they're

 as scarce as pork at a Ear Mitzvah.That last paragraph was written on Thursday, on Friday I found out that there are still a limited rumber of those Datasettes still available but if you want one you had better be quick as they are going fast. Now, more news about the UZ300 program books that we have been waiting for with Bated Breath for the last twelve monthe. Wait for it, they have finally arrived (Gasp). After eagerly broweing through the two newies I came away disapointed. It seems that D.S.E are in such a deep rut they can't climb out of it. These New books are nothing more than the old $U Z 200$ books recovered and are three years old at the very least. What's happened at Tricky Dickies. Can it be they're scared to bring anything new out in case Faul Keating Taxes it or is it just Apathy regarding the $V Z$. Am I crying in the wilderness or will I be heard down there in wonderland. Stay tuned for the next boring episode. All jokes aside though, I will say that even old books are better than no books to someone who has nothing better to look to for help so 5 out of 10 for. trying to D.S.E.

Have you noticed the price rises on the $V Z$ gear lately.
This one we'll certinaly blame on everybodies friend Mr.K. (the blames gotta go somewhere and he's handy). Gk, I've had my whinge so now you can do more important things, like reading the rest of this newsletter. See you in the funny pages.

Pete.

From small acorns, do mighty oaks grow. Well something like that, anyway. By this I don't mean that the founding members of the Hunter Valley VZ Users' Group are nuts; but, a recent update of our Membership list shows that we are now thirty strong. Great stuff! And to that we have Subscriber type Members, from the Central Coast, Rockhampton, Adelaide and country N.S.W.

Two contacts made in Queensland during the last month, the first, Dave Mitchell, who will be writing articles for our Newsletter on a regular basis (suprise Dave), and also initial contact has been established with Bob Kitch from Kenmore (near. Bristane I think). Bob has collected a massive amourit of articles on software, hardware or anywhere to do with the VZ. It's also possible that Bob will become a contributor as well. Thanks for your letters Gontlemen. Who said the only good thing to come out Queensland was the main road?, they were wrong. It's VZ articles and the main road. Looking foward to a first article from both of these Members (soon).

The GROUF is currently considering purchasing a few cheap cassette recorders with the aim of seriding one to each of the proven regular contributors. All articles could then be typed on the Word Processor program, the files saved to tape, and sent to me. The idea of every one using the same type of cassette player is to try and get away from the huge problem of loading errors. This is, in the maing a lot to with incompatability of cassette players.

Sorry folks, but there is no games review in this Issue. our resident Games Reviewers are away on school holidays.

Seems the couple of worries that $I$ wrote of in last months editorial have been solved. Thanks folks!

Great to see a couple of Mums along at the last meeting. Leigh, our (to date anyway) female Member, should have felt a little more at ease. (And a little less of Chris. HA!)

Seen or heard anything funny to do with computers lately? Are you a closet cartoon fan. We decided two issues ago to put some funnies ing but sadly, we are running out of them. Help!

Thanks to all who helped "save the day" with the assembling of the last Newsletter. Also thanks to Kevin Linsell, who showed up for the first time, last meeting, and ended up running off our spare and subscriber copies.

Inside you'll find the second section of the article by Robert Quinn, this will probably be a five part article. Also we have put another program in the Beginners Section. There are two interesting reviews on add-on gear for the $V Z$. The serial interface as reviewed by Ross Woods, and the Radio Teletype (RTTY) kit from Rudy, reviewed by feter Ellis. Thanks fellas!

Just a final point to remember, thats if you, or if you hear of anyone who lives too far away, (or has other commitments) to attend our first thursday of every month meetings at st.Marks Church hall in Islington, then remember we now have the facilities to handle Subscribers. A few phone numbers listed below:

| Gavin | $(049)$ | 621678 |

## BATTERY BACKUP RAM BY DAVE ROYCE

This description will cover Eatery BackUp static FAM in any location, although this article is set up for (decoding only) in the $6000 H$ to $67 F F H$ area. That is the $2 K$ gap left by the Disk Controller. Non Disk users can put an extra $8 K$ RAM in the $4000 H$ to 5FFFH area. Inside the VZ200 the 7425135 has two unused decoded outputs, Pin 6 ( $8 K$ Block) and Pin 12 (2K Block). Fir i 12 is the ane used in this article although an alternate decoder (74LS138) is shown for persons not wishing to open up their VZ200, or for VZ300 owners. For alternate 8K decoding see previous issue of this newsletter.

The operation of DATA. retention is fairly easily achieved. Referirg to the circuit diagram locate the 4 Way DIP Switch. iou will find that only 3 Switches are used for the Battery BackUp feature. $\quad 53$ (Switch 3 ) is not used and no connection is made to it.

S1 -Controls the main power supply from the $V Z$ to the RAM.
52 - Controls the +3V (2 $x$ AAA) Battery BackUp Supply.
53 - No connection to this Switch and is not used.
S4 - ENABLES or DISAELES the WRITE line from the VZ to the $2 k$ RAM Chip.

Ensure that $S 1$ is ON when the $V Z$ is $O N$ or You will not be able to WRITE to the RAM.

To WRITE to the RAM 51 and 54 must be ON.
To PROTECT RAM DATA while the $V Z$ is ON, turn OFF S4.
To PROTECT RAM DATA while the $V Z$ is GFF :- Before turning the UZ OFF ENSURE that $S 2$ is $O N$ and $S 4$ are $O F F$.

To ERASE DATA while the $V Z$ is GFF, turn $S 2$ OF.
To ERASE DATA while the $V Z$ is ON :- Turn $S 1$ and 52 OFF. Wait approx. 10 EEc's. before turning 51 back aN. 52 is optional.

NOTE -- Before REMOVING or REPLACING the Batteries ensure that 52 is in the OFF position.

Use ALKALINE batteries only. (NOT Nickle Cadmium).
NOTE -- DO NOT REMOVE the $2 K$ RAM Chip from it's Socket UNLESS the UZ is GFF and 52 is GFF as well.

'He's already working on his third novel.'

TO PROTECT WITH VZ ON OR BEFORE TURNING VZ OFF

## CORRECTIONS - "*" SHOWS DATA INADVERTENTLY OMITTED

The UZ Serial Interface is sold as an "add-on" kit project from D.S.E. It is priced in the catologue at $\$ 49.95$ and is CAT\# K-6317.

When constucted, this kit, with the addition of a modem and telephone line, allows the $V Z 200 / 300$ to commuricate with electronic bulletin boards and data bases.

I constructed the kit and borrowed a modem, and soon managed to increase my telephone bill by ringing up databases out of the local phone area. The only datatase $I$ contacted in Newcastle was the Micro-computer club. This database allows electronic mail, questions and answers, plus other information.

The Serial Interface turns the $V Z$ into a "GLASS" terminal. It must be noted that chis kit only allows terminal operation; ie: no saving to disk or tape and no transfer of memory contents. However, it does allow the $V Z$ to control another computer, from anywhere in the world, $v i a$ a telephone line and modem. The information can be sent from the $V Z$ and recieved back on both screen and printer.

Physical details of the kit. The interface plugs into the memory expansion port of the $V Z$, the case supplied is identical to that of the memory expansion module. The connection to the modem is via a 25 pin RS232 plug fitted to the rear of the case. Only three connections are used, these are EARTH, RECIEVE and SEND. I also fitted a switch to the recieve and send lines to allow reversing the function. This was not part of the kit. This enables the interface to drive a serial printer directly fro modem) or, for that matter, any other serial devices directly.

I experienced no major problems in constucting the kit. I would suggest that some experience in fine/close soldering be obtained, before tackling this kit. It is rated by D.S.E. as (three star) 米米, construction difficulty. $_{\text {dict }}$

No terminal program is required. The program is in ROM and when the Serial Interface is connected, it is available on power up of the $V Z$. This unit runs at the speed of 300 BAUD.

## MENU OPTIONS.

(O) Enter terminal
(1) full-half duplex
(2) toggle printer: on/off
(3) set data bits: 3 or 7
(4) set stop bits
(5) set parity: odd, even or none
(6) add line feed to carriage returr

SHIFT $X$ to exit terminal.

PRINTER SHARER, COMFUTER SHARER \& SERIAL BOARD.
This month $I$ will (try tol descrite in a little more detail the above three units from Don Mckenzie. This is, of courseg a continuation of last months article on the PBUFF.

## PRINTER SHARER.

This unit will allow the user, at the flick of a switch, to access two printers from the output of the Buffer, or from the printer interface alone. This saves having to power down while you change the printers over. But, you must also remember that generally, while one printer is working (printing), you can not switch over. There is an exception to this rule though - see below in the PBUFF additions under HARDWARE PAUSE. These boards may be 'stacked' which will allow more printers for anything that looks. like a printer e.g. speech) to fed from the one Buffer.

My own system cirsists of : VZ300 (RAM to FFFFH), Datacassette, Disk Drive, Joysticks, 64 K RAM Frinter Buffer, Printer Sharer, Dot Matrix Frinter and PP-40 Printer Plotter.

COMFUTER SHARER.
This unit is in effect a Frinter Sharer in reverse. This allows two computers to feed into one printer, or looking further, feed into a PBUFF which will run a printer or into a Printer Sharer. The computers need not be the same e.g. a $V Z$ and a C-64 (with interface). These boards may also be 'stacked', this will allow more computers to feed into a fBUFF or frinter Sharer.

SERIAL BGARD. RE-232.
This unit will allow the user who has either :-
(1) Serial Input only Printer.
(2) Serial out only Computer
(3) or Serial only System
to use the PBUFF and its add-ons with practically any of RS-232 / Parrallel (Centronics) computer ann printer combination.

PBUFF ADDITIONS. Software and Hardware Fauses.
The software pause is activated by sending a double backslash N. Sending this string will stop the PBUFF in its tracks. You can deactivate this command if necessary, e.g. you may have to send this string to a printer (or some other device).

The hardware pause can be used to stop the printer at any time. Only while the hardware pause is activated may you change over to the other printer.

The printer sharer and computer sharer boards with instructions cost $\$ 12$ each and approx. $\$ 54$ to construct. The RS-232 serial board with instuction is $\$ 18$ to buy, construction中- $\ddagger$ ?

For more information on these three units and the fBuFF, contact:-

ARTICLE WRITTEN by dave boyce.

#  

THIS IS A CONTINUATION GF THE ARTICLE STARTED IN THE AUGUST EDITION.

An address pointer stores the address it 'points' to in a LO, HI format according to the formula:
address $=L O+H I \times 256$
where LO is the number (the LO byte) stored in the first of the memory cells making up the pointer and $H I$ is the number (the HI bytel stored in the second cell. To determine the address pointer we need to know the addresses of the two cells of the pointer. Then we can PEEK at those cells to find LO and HI. 3088430885 are the addresses of the START OF PROGRAM pointer. So, if you switch on your $V Z$ and enter this command:

PRINT PEEK(30884) + PEEK (30885) $\times 256$
you will discover the start of program address.
You got 31465 ? That is the usual start address of program memory, which follows on from the end of the commurications region. When we enter basic program lines, whether we type them in using the keyboard, CLOAD them from tape or LaAD them from disk, the lines take up residence in RAll from this point on.

31465 is the start address for the line with the lowest line number in a BASIC program. Lines are stored in the sequence of their line numbers. Add a new line, and all the lines with higher line numbers will be pushed up in program memory to create a slot for the new line. Delete a line, and all the higher numbered lines will be pulled down to close the gap.

To explore the structure of program lines in memory, enter this two line program and RUN it:

10 FOR $A=31465$ TO $A+37:$ PRINT PEEK $(A) ;: N E X T$
20 PRINT:LIST-20

The program has listed itself in two different ways. Line 20 performed the familiar BASIC listing of the program. Line 10 produced a PEEK listing of the program as a sequence of numbers stored in memory cells from 31465 onwards. How do the two compare? In the BASIC listing each program line has a number, a set of BASIC words (FOR, $=$, TO, FRINT, PEEK, etc.) and various other characters (digits, colons, brackets, A, etc.) which, together with the associated BASIC words, make up BASIC statements.

Now add these lines to the program:
30 CLS:FOR $A=31465$ TO $A+\Im 7: X=F E E K(A)$
40 IF $x>31$ AND $X<95$ THEN PRINT CHR央( $x$ ); ELSE PRINT $X ;$
50 NEXT:FRINT:PRINT:GOTO 10
and RUN 30.

The top PEEK listing provides an ASCII decoding of those bytes that fall within the ASCII range. Variables, digits, brackets, colons, semicolons come through, arid if we compare the two feek listings it is not hard to figure out where the line numbers occur. But where are the BASIC words? Their positions in the lines seem to be occupied by triple-digit numbers. Apparently more decoding is necessary. Add this lifie to the program and RUN 30 again:

## 5 REM A TEST OF THE ASCII PEEK LISTING

The text of the REM statement gets thorough ASCII decoding, letter by letter, blank by blank. Even the BASIC word FEEK is ASCII decoded, though it was not decoded in the previous RUN.

The text of a BAEIC line always begins with the fifth byte for that line. The third and fourth bytes are the line rumber. Only two bytes (no mores no less) are used to record fiow many digits the line number, using the LO HI format, no matter how many digits the number may have:
line number $=$ byte $3+b y t e 4 \times 256$
Because the 1 ine numbers in this program are small, byte 4 is ' 0 ', which is $0 \times 256$. The first two bytes of a BASIC line record the start address of the next line in the program, again according to the LO HI formula:
start address of line $=$ byte $1+$ byte $2 \times 256$
If we delete line 5 and RUN SO we see that the first two bytes of line 10 are '4' and ' $123^{\prime}$ ' which gives us the start address for line 20 as $4+123 \times 256=31492$.

FRINT PEEK(31492) gives us 15. If we lacate '20? in the PEEK listing as the third byte of lirie 20 , we see that byte 1 of line 20 (two locations back from the number 20) is '15.' But if '15' is the first byte of line 20 then the ' 0 ' to the left of '15' must be the last byte of line 10. Indeed, the last byte of every line is a 'o', a marker indicating that this line ends here. There is even a pseudo-end of line marker in the memory cell preceding the first byte of the first line of a program-- a zero at address 31464 , the last cell of the communications region. If this byte is POKE changed to a non-zero value, your program will not RUN.

Note that in the REM statement FEEK occupied four bytes of memory, one byte for each character:

| 80 | 69 | 69 | 75 |
| :--- | :--- | :--- | :--- |
| $P$ | $E$ | $E$ | $K$ |

In line 10 , however, the position of the FEEK word is occupied by a triple-digit number -- 229.

## UNDERETANDING YOUR VZ.. .FART TWO.

This byte '229' is a token code for PEEK. Every BASIC word is represented in text of program lines (once they have passed into program memory) by a unique token code, a number between 128 and 250. A one byte token uses up three memory cells less than the four character word PEEK. And since BASIC words constitute a major part of most programs, tokenisation results in considerable saving of memory occupied by a frogram. In the text of a REM, FRINT or LPRINT statement, words like PEEK, FOR, GOSUB are not regarded as BASIC words; they are just strings of characters to be displayed and are not tokenised. Inverse and graphic characters are also coded using numbers greater than 127. They are distinguished from the token codes for EASIC words by their relation to quotes (""). Within quotes such numbers are interpreted as character codes; outside quotes they are token codes.

Orie peculiarity is the ELSE statement. ELSE is always preceded in memory $b y$ a colon (:), but the colon is never displayed when lines are LISTed or LLISTed. you have to count this invisible colon to get an accurate estimate of the length of a line involving ELSE statements.

Enter the TOKEN routine and RUN. The routine will display all the basic words that make up the UZ's BASIC VOCAEULARY, along with their token codes. Fress any character key to halt the display. Press again to continue. If you have a FP4O (or TF40) printer then Token will LPRINT a hard copy of all the words and their codes if you RUN 100.

Well here we go at trying to give you a bit of an explanation about the preceeding program in this manths BEGINNERS SECTION. I'll only go over those lines/routines where I feel an explaination is required. There are in fact many programs like this around, but this is a very simple version. It can be lots of fun, when you have mastered it, test the rest of the family.

110 SHIFT + J 32 times.
1304 SFACES then in INVERSE alternated with a space
180 a delay loop
260 CAREFUL - the last one of these is an INFUT
320 if you press any other key than those you are tald to, then the garne will go straight into ADDITION

350 makes sure the questions are totally RANDOM
360 \& 370 sets levels, that is relation to what you pressed a.t the start

410 to 460 this routine is used every time you answer a question, to see if you get it right or wrong

450 keeps track of all the questions that you answer
correct1y
480 goes to the "GAME GVEF" routine when all questions have been attempted

490 to 560 as above, but for subtraction
570 to 710 again, as above, but for division
610 makes sure you don't get asked division by zeRU questions

660 \&e 570 checks that all questions asked will have WHOLE NUMBERS (intergers) as answers. Don't want things like 150/157, do we?

720 to 800 routine for multiplication
820 to 890 game over routine. Tallies up how many answers wrong and right, then works this out into a percentage form

Some time ago D. S.E introduced the VZ R.T.T.Y Kit for people who are into Radio as a hobby. This Kit proved to be a bit of a flop because it had only one baud speed. Now as any Ham knows, one Baud speed is as useful as a toothache. A good mate of minie, also a club member and a local Ham radio operator well known in the Newcastle area (All this in orie bloke) is Rudy Meinsma UK2FIM. Rudy decided to go a couple of steps further and developed his own unit. This unit has been up and runining for some time row and is proving quite popular in the Hunter Region.

This VZ200-300 rtty interface also harides morse code. The P.C.B, outlay of the P.C.B, circuit, partslist, and instructions are now available to enable you to construct a superior urit which will give exellent results.

The main features are:
1..split screen display fur $T X$ and $R X$
2. .fully buffered trarsmit keyboard with 1000 char. buffer.
3. .nine message mencries which can be saved perm. on tape or disk with the software prog.
4. .speed is key selectable from 45 Baud to 99 Baud for rtty and 5 to 99 upm for morse.
5., ability to type in TX buffer while receiving.
6. .line printer driver.
7..sync idle on transmit.
8. .morse sent as audio to both internal speaker and cassette output.
9. Shift can be swicthed from $170 \mathrm{HZ}-425 \mathrm{HZ}$ to 850 HZ to tune in on commercial rity or news broadcasts.

The circuitry is quite simple and should be no problem in construction. 3 ICs, 5 trarsistors, 3 preset pots, LED for fine tune arid a handful of resistors and capacitors.

Cost of the P.C.B and necessary paperwork is $\$ 18$ plus $\$ 1$ post. If you are interested you may phone Rudy on (o49) 437548.

'You actually make use of it, then - not just for playing games.'
